Project Description

SmartLearn will be an online **Learning Management System (LMS)** that helps both **students and teachers** manage the learning process easily.

Teachers will be able to create courses, upload lessons, add quizzes, and track students' performance.

Students will join courses, view learning materials, submit assignments, and check their grades.

The main goal of the project is to **make education more organized, interactive, and accessible** using technology.

Software Development Life Cycle (SDLC)

To complete the project successfully, the team will follow the main phases of the **Software Development Life Cycle (SDLC)**:

1. Requirement Analysis

The team will collect requirements from students and teachers.

The main features will include:

- Course creation and management
- Uploading and viewing materials
- Online quizzes and grading system

2. System Design

In this phase, the team will design the structure of the system:

- Create the database design (users, courses, grades, etc.)
- Plan the main pages such as login, dashboard, and course pages
- Build UI sketches and diagrams

3. Testing

After the design is completed, the system will be tested to make sure every part works correctly.

Testing will include functions like login, course enrollment, and quiz submission.

4. Deployment

When the system is ready, it will be deployed online so users can access it through a web browser.

5. Maintenance

After deployment, the team will keep monitoring the system, fix any issues, and add new features based on user feedback.

Project Goal

The main goal of SmartLearn is to **create a digital platform that supports modern education** and helps students and teachers connect, learn, and grow in a simple and effective way.
